1 Preorders

Definition 1.1 (Preorder)**.** *A relation $\leq$ is a* preorder *if it is reflexive and transitive.*

Definition 1.2 (Property of preorders)**.** *A* property $\mathbf{P}$ *of preorders is a class of preorders which is closed under isomorphism.*

Definition 1.3. *A property $\mathbf{P}$ of preorders is* monotone *if for every preorder M, $M \in \mathbf{P}$ implies that every suborder of M is in $\mathbf{P}$.*

Definition 1.4. *A property $\mathbf{P}$ of preorders is an* additive property *if for every preorders M_1 and M_2, $M_1 + M_2 \in \mathbf{P}$ iff $M_1, M_2 \in \mathbf{P}$, i.e., if $\mathbf{P} + \mathbf{P} = \mathbf{P}$.*

Definition 1.5. *Let M be a preorder.*

Then M^* is the dual - the reverse preorder of M.

Definition 1.6 (Sum of preorders)**.** *Let I be a preorder, and let $\{M_i\}_{i\in I}$ be a family of preorders.*

The sum $M = \sum_{i\in I} M_i$ is defined as follows:

The domain is $M = \biguplus_{i\in I} M_i$ (a disjoint union).

Let $\leq_i$ be the preorder on M_i.

The order is defined as follows:

$$x \leq y \iff \begin{cases} \exists i \in I. x, y \in M_i \wedge x \leq_i y \\ \exists i, j \in I. x \in M_i \wedge y \in M_j \wedge i < j \end{cases}$$

If $I = 2$, we define $M_1 + M_2 := \sum_{i\in 2} M_i$.

Lemma 1.7. *Let I be a preorder, and let $\{M_i\}_{i\in I}$ be a family of preorders.*

Then $M = \sum_{i\in I} M_i$ is a preorder.

Proof. Reflexivity is clear.

For transitivity, suppose $x \leq y$ and $y \leq z$.

Suppose $x \in M_i$, $y \in M_j$, $z \in M_k$.

Then $i \leq j$ and $j \leq k$, so $i \leq k$. If $i = k$, then necessarily $i = j = k$, and so $x \leq_i y$ and $y \leq_i z$, so $x \leq_i z$, so $x \leq z$, as required.

Otherwise, $i < k$, and thus $x \leq z$, as required. □

Definition 1.8. *Let $\mathbf{P}_1$ and $\mathbf{P}_2$ be properties of preorders.*

Then we define

$$\mathbf{P}_1 + \mathbf{P}_2 := \{M_1 + M_2 : M_1 \in \mathbf{P}_1 \wedge M_2 \in \mathbf{P}_2\}$$

Definition 1.9. *Let $\mathbf{P}$ and $\mathbf{Q}$ be a property of preorders.*

Then we define

$$\sum_{\mathbf{P}}^{\mathbf{Q}} := \left\{ \sum_{i\in I} M_i : I \in \mathbf{P} \wedge \forall i \in I. M_i \in \mathbf{Q} \right\}$$

Furthermore, if $\mathbf{P} = \{I\}$ is a singleton, we define $\sum_I^{\mathbf{Q}} := \sum_{\mathbf{P}} \mathbf{Q}$.

Definition 1.10 (Kleene plus)**.** *Let* $\mathbf{P}$ *be a property of preorders.*

We define its Kleene plus as the smallest property of preorders $\mathbf{P}^+$ *which contains* $\mathbf{P}$ *and is closed under finite sums.*

That is, $1^+ = \{1, 2, \ldots\}$*, and* $\mathbf{P}^+ = \sum_{1^+}^{\mathbf{P}}$.

2 Linear Orders

Definition 2.1. *Let M be a linear order.*

A set $A \subseteq M$ is left cofinal *in M if for every $x \in M$, there exists $y \in A$ such that $y < x$.*

A set $A \subseteq M$ is right cofinal *in M if for every $x \in M$, there exists $y \in A$ such that $x < y$.*

A set $A \subseteq M$ is bi-directionally cofinal *in M if it is both left and right cofinal.*

Lemma 2.2. *Let $\mathbf{P}$ be an additive property of linear orders.*

Then $1 \in \mathbf{P}$.

Note 2.3. *The above lemma is false if we do not restrict ourselves to linear orders.*

For example, $(1 \uplus 1)^+$ is a property of preorders which is additive, but does not contain 1.

Proof. Let $M \in \mathbf{P}$ be any linear order.

Let $x \in M$. Then, $M = \{y \in M : y < x\} + \{x\} + y \in M : y > x$.

We conclude that $\{x\} \in \mathbf{P}$, thus $1 \in \mathbf{P}$. $\square$

Corollary 2.4. *Let $\mathbf{P}$ be an additive property of linear orders.*

Let M be a linear order.

Let $x, y \in M$ be any two points in a linear order M. Then the following are equivalent:

1. $(x, y) \in \mathbf{P}$.
2. $(x, y] \in \mathbf{P}$.
3. $[x, y) \in \mathbf{P}$.
4. $[x, y] \in \mathbf{P}$.

Definition 2.5. *Let $\mathbf{P}$ be a property of linear orders.*

We define $\mathcal{B}[\mathbf{P}]$ to be the class of linear orders M such that for every $x, y \in M$, the bounded subinterval $[x, y]$ is in $\mathbf{P}$.

Definition 2.6. *A property $\mathbf{P}$ of linear orders is a* star property *if for every linear orders M, and every family $\mathcal{F} \subseteq \mathbf{P}$ of subintervals of M such that $J_1 \cap J_2 \neq \emptyset$ for every $J_1, J_2 \in \mathcal{F}$, we have that $\bigcup \mathcal{F} \in \mathbf{P}$.*

Lemma 2.7 (Star Lemma)**.** *Let $\mathbf{P}$ be an additive property of linear orders.*

Then the property $\mathcal{B}[\mathbf{P}]$ is a star property.

Proof. Let M be a linear order, and let $\mathcal{F} \subseteq \mathcal{B}[\mathbf{P}]$ be a family of subintervals of M.

Let $[x, y] \subseteq \bigcup \mathcal{F}$ be any bounded subinterval. We need to prove it is in $\mathbf{P}$.

Suppose $x \in J_1$ and $y \in J_2$ for $J_1, J_2 \in \mathcal{F}$.

Since $J_1 \cap J_2 \neq \emptyset$, we can take $z \in J_1 \cap J_2$.

Then $[x,z] \subseteq J_1$ and $[z,y] \subseteq J_2$, and thus by $\mathcal{B}[\mathbf{P}]$, $[x,z],[z,y] \in \mathbf{P}$. However, $\mathbf{P}$ is additive. Since $[x,y]$ is either the sum or difference of $[x,z]$ and $[z,y]$, we have that $[x,y] \in \mathbf{P}$. □

Lemma 2.8. *Let* $\mathbf{P}$ *be a star property.*

Then for every linear order M*, and every point* $x \in M$*, there exists a largest subinterval* $J \subseteq M$ *such that* $J \in \mathbf{P}$.

Equivalently, we can define a convex equivalence relation $\sim_{\mathbf{P}}$ *on* M *such that* $x \sim_{\mathbf{P}} y$ *iff* $[x,y] \in \mathbf{P}$.

That is, $x \sim_{\mathbf{P}} y$ *iff* x *and* y *are in the same largest* $\mathbf{P}$*-subinterval.*

Proof. Let $J \subseteq M$ be the union of all $\mathcal{B}[\mathbf{P}]$-subintervals containing x. All such subintervals intersect at x.

Therefore, by the star lemma, J is in $\mathcal{B}[\mathbf{P}]$, and by definition J is the largest $\mathbf{P}$-subinterval containing x.

Thus we can define the equivalence relation $\sim_{\mathbf{P}}$ as above. □

Definition 2.9. *A property* $\mathbf{P}$ *of linear orders is* good *if it is monotone, additive and* $\omega^* + \omega \in \mathbf{P}$.

Definition 2.10. *Let* I *be a linear order labeled with colors* $\vec{C} = \{C_k\}_{k=1}^m$*. Let* $\gamma : I \to \vec{C}$ *be the coloring function.*

Let $\vec{M} = \{M_k\}_{k=1}^m$ *be a family of labeled linear orders.*

Then,

$$\sum_I \left[\vec{C} \leftarrow \vec{M}\right] := \sum_{i \in I} M_{\gamma(i)}$$

Lemma 2.11 (Associativity of sum)**.** *Let* $\mathbf{P}_1$*,* $\mathbf{P}_2$ *and* $\mathbf{P}_3$ *be properties.*

Then $\sum_{\mathbf{P}_1} \sum_{\mathbf{P}_2} \mathbf{P}_3 = \sum_{\sum_{\mathbf{P}_1} \mathbf{P}_2} \mathbf{P}_3$.

Proof. It follows directly from the associativity of the sum operation on linear orders. Actually, it generalizes to any algebraic equation which holds on linear orders. □

Lemma 2.12 (Union-associativity of sum)**.** *Let* $\mathcal{P}$ *be a family of properties.*

Let $\mathbf{Q}$ *be a property.*

Then $\sum_{\bigcup \mathcal{P}} \mathbf{Q} = \bigcup_{\mathbf{P} \in \mathcal{P}} \sum_{\mathbf{P}} \mathbf{Q}$.

Proof. This is obvious from the definition of the sum operation. □

Definition 2.13. *Let* $\beta \geq \omega$ *be a limit ordinal.*

We define $\Gamma_\beta := \{\gamma : \gamma \subseteq \beta^* + \beta\}^+$.

Example 2.14.

$$\Gamma_\omega = \{1, \omega, \omega^*\}^+$$

Observation 2.15. *Let* $\beta \geq \omega$ *be a limit ordinal.*

Then Γ_β *is a good property of linear orders.*

3 General Hausdorff Rank

Definition 3.1. *Let $\mathbf{Q}$ be a good property of linear orders.*
We define a property $\mathbf{Q}^{<\alpha}$ for every ordinal $\alpha > 0$ as follows:

- *For $\alpha = 1$, $\mathbf{Q}^{<1} = \{1\}$.*
- *For $1 < \alpha = \gamma + 1$,*
$$\mathbf{Q}^{<\alpha} = \sum_{\mathbf{Q}} \mathbf{Q}^{<\gamma}$$
- *For α a limit ordinal,*
$$\mathbf{Q}^{<\alpha} = \bigcup_{\beta<\alpha} \mathbf{Q}^{<\beta}$$

We define further $\mathbf{Q}^{\leq\alpha} = \mathbf{Q}^{<\alpha+1}$ and $\mathbf{Q}^{=\alpha} = \mathbf{Q}^{\leq\alpha} - \mathbf{Q}^{<\alpha}$.
We call such an α, if it exists, the $\mathbf{Q}$-rank *of a linear order M.*

Observations 3.2. *Let $\alpha, \beta > 0$ be ordinals.*
Let $\mathbf{Q}$ be a good property.
We claim the following without proof:

- $\mathbf{Q}^{\leq 1} = \mathbf{Q}$.
- $\mathbf{Q}^{<\alpha}$ *is a good property iff $\alpha > 1$.*
- $\mathbf{Q}^{<\alpha} \subsetneq \mathbf{Q}^{<\beta}$ *iff $\alpha < \beta$.*

Lemma 3.3. *Let $\alpha > 0$, $\delta \geq 0$ be ordinals. Let $\mathbf{Q}$ be a good property.*
Then,
$$\mathbf{Q}^{<\alpha+\delta} = \sum_{\mathbf{Q}^{<1+\delta}} \mathbf{Q}^{<\alpha}$$

Proof. We prove by induction on $\delta \geq 0$.
For $\delta = 0$, we need to show that $\mathbf{Q}^{<\alpha} = \sum_1 \mathbf{Q}^{<\alpha}$, which is obviously true.
For $\delta = \varepsilon + 1$, we have $\mathbf{Q}^{<\alpha+\delta} = \mathbf{Q}^{<\alpha+\varepsilon+1} = \sum_{\mathbf{Q}} \mathbf{Q}^{<\alpha+\varepsilon}$.
By the induction hypothesis, $\mathbf{Q}^{<\alpha+\varepsilon} = \sum_{\mathbf{Q}^{<1+\varepsilon}} \mathbf{Q}^{<\alpha}$, and thus we get

$$\mathbf{Q}^{<\alpha+\delta} = \sum_{\mathbf{Q}} \sum_{\mathbf{Q}^{<1+\varepsilon}} \mathbf{Q}^{<\alpha}$$

By associativity,

$$\mathbf{Q}^{<\alpha+\delta} = \sum_{\sum_{\mathbf{Q}} \mathbf{Q}^{<1+\varepsilon}} \mathbf{Q}^{<\alpha} = \sum_{\mathbf{Q}^{<1+\varepsilon+1}} \mathbf{Q}^{<\alpha} = \sum_{\mathbf{Q}^{<1+\delta}} \mathbf{Q}^{<\alpha}$$

For $\delta > 0$ a limit ordinal, note that $\alpha + \delta = \sup_{\varepsilon<\delta} \alpha + \varepsilon$, and $1 + \delta = \delta$ since δ is infinite.

Then,

$$\mathbf{Q}^{<\alpha+\delta} = \bigcup_{\varepsilon<\delta} \mathbf{Q}^{<\alpha+\varepsilon} = \bigcup_{\varepsilon<\delta} \sum_{\mathbf{Q}^{<1+\varepsilon}} \mathbf{Q}^{<\alpha} = \sum_{\bigcup_{\varepsilon<\delta} \mathbf{Q}^{<1+\varepsilon}} \mathbf{Q}^{<\alpha} = \sum_{\mathbf{Q}^{<1+\delta}} \mathbf{Q}^{<\alpha}$$

where the second equality follows by the induction hypothesis.

□

Lemma 3.4. *Let $\alpha > 0$ be an ordinal.*
Let $\mathbf{Q}$ be a good property.
Then over countable linear orders, $\mathcal{B}\left[\mathbf{Q}^{<\alpha}\right] \subseteq \mathbf{Q}^{\leq\alpha}$.

Proof. Let $M \in \mathcal{B}\left[\mathbf{Q}^{<\alpha}\right]$ be a countable linear order.

Since M is countable, there exists some $I \subseteq \omega^* + \omega$ and an I-sequence $\{x_k\}_{k\in I} \subseteq M$, which is bi-directionally cofinal in M.

That is, $M = \sum_{k\in I} [x_k, x_{k+1})$.

Since $I \subseteq \omega^* + \omega \in \mathbf{Q}$, and since the rank of every interval $[x_k, x_{k+1})$ is $< \alpha$, $M \in \sum_{\mathbf{Q}} \mathbf{Q}^{<\alpha} = \mathbf{Q}^{\leq\alpha}$.

□

4 ω-Hausdorff rank

Lemma 4.1. *Let $\alpha > 0$ be an ordinal.*

Let M be a countable linear order.

Then $M \in \Gamma_\omega^{\leq\alpha}$ iff M is a finite sum of $\mathcal{B}\,[\Gamma_\omega^{<\alpha}]$-subintervals.

Proof. From the previous lemma, it is clear that if M is a finite sum of $\mathcal{B}\,[\Gamma_\omega^{<\alpha}]$-subintervals, then $M \in \Gamma_\omega^{\leq\alpha}$, since the rank bound is preserved under finite sums.

Conversely, suppose $M \in \Gamma_\omega^{\leq\alpha}$.

If $M = \sum_{i\in I} M_i$ for some M_i of Hausdorff rank $< \alpha$ for $I \in \Gamma_\omega$, take $x, y \in M$. Then let $x \in M_{i_1}$ and $y \in M_{i_2}$.

Then $[x, y] \subseteq \sum_{i\in[i_1,i_2]} M_i$.

But the distance between i_1 and i_2 is at most 1, so $\sum_{i\in[i_1,i_2]} M_i$ is a finite sum of $\mathcal{B}\,[\Gamma_\omega^{<\alpha}]$-subintervals.

So we have proven that each interval which is a Γ_ω-sum of linear orders of ω-rank $< \alpha$ is in $\mathcal{B}\,[\Gamma_\omega^{<\alpha}]$.

But generally, M is a finite sum of such $\omega^* + \omega$-sums, so it is a finite sums of $\mathcal{B}\,[\Gamma_\omega^{<\alpha}]$-subintervals. □

Definitions 4.2. *Let $\alpha > 0$ be an ordinal.*

Let M be a linear order.

We define:

1. $\mathcal{L}_\alpha := \{M \in \mathcal{B}\,[\Gamma_\omega^{<\alpha}] : 1 + M \in \mathcal{B}\,[\Gamma_\omega^{<\alpha}]\}$
2. $\mathcal{R}_\alpha := \{M \in \mathcal{B}\,[\Gamma_\omega^{<\alpha}] : M + 1 \in \mathcal{B}\,[\Gamma_\omega^{<\alpha}]\}$

And then:

1. $\mathcal{S}_\alpha^1 := L_\alpha \cap R_\alpha$
2. $\mathcal{S}_\alpha^\omega := L_\alpha \setminus R_\alpha$
3. $\mathcal{S}_\alpha^{\omega^*} := R_\alpha \setminus L_\alpha$
4. $\mathcal{S}_\alpha^{\omega^*+\omega} := B_\alpha \setminus (L_\alpha \cup R_\alpha)$

In particular, by the definition,

$$\mathcal{B}\left[\Gamma_\omega^{<\alpha}\right] = \mathcal{S}_\alpha^1 \uplus \mathcal{S}_\alpha^\omega \uplus \mathcal{S}_\alpha^{\omega^*} \uplus \mathcal{S}_\alpha^{\omega^*+\omega}$$

Let $M \in \mathcal{B}\,[\Gamma_\omega^{<\alpha}]$.

We define the *α-shape of M to be the $s \in \{1, \omega, \omega^*, \omega^* + \omega\}$ for which $M \in \mathcal{S}_\alpha^s$.*

Lemma 4.3.

$$\mathcal{S}_\alpha^1 = \Gamma_\omega^{<\alpha}$$

Proof. ($\supseteq$) Let $M \in \Gamma_\omega^{<\alpha}$. Since $\Gamma_\omega^{<\alpha}$ is additive, $1+M$ and $M+1$ are also in $\Gamma_\omega^{<\alpha}$. Therefore, $M \in \mathcal{L}_\alpha \cap \mathcal{R}_\alpha = \mathcal{S}_\alpha^1$.

($\subseteq$) Let $M \in \mathcal{S}_\alpha^1$. Then $M \in \mathcal{L}_\alpha$ and $M \in \mathcal{R}_\alpha$, so $1+M, M+1 \in \mathcal{B}\left[\Gamma_\omega^{<\alpha}\right]$.

By lemma 2.7, $\mathcal{B}\left[\Gamma_\omega^{<\alpha}\right]$ is a star property. So $1+M+1 \in \mathcal{B}\left[\Gamma_\omega^{<\alpha}\right]$. Since it is by itself an interval, it is in $\Gamma_\omega^{<\alpha}$.

By monotonicity, $M \in \Gamma_\omega^{<\alpha}$. □

Corollary 4.4. *Let $\alpha > 0$, $\delta \geq 0$ be ordinals.*

Then,

$$\mathcal{S}_{\alpha+\delta}^1 = \sum_{\mathcal{S}_{1+\delta}^1} \Gamma_\omega^{<\alpha}$$

Proof.

$$\mathcal{S}_{\alpha+\delta}^1 = \Gamma_\omega^{<\alpha+\delta}$$

□

Lemma 4.5. *Let $\alpha > 0$ be an ordinal. Let $s \in \{\omega, \omega^*, \omega^* + \omega\}$.*

Suppose that $\alpha = \sup_{i \in s}(\alpha_i + 1)$ for ordinals $\alpha_i > 0$ for all $i \in s$.

Then, we have the following:

$$\mathcal{S}_\alpha^s = \sum_{i \in s} \Gamma_\omega^{<\alpha_i}$$

Proof. □

Corollary 4.6. *Let $\alpha > 0$, $\delta \geq 0$ be ordinals.*

Let $s \in \{\omega, \omega^*, \omega^* + \omega\}$

Then,

$$\mathcal{S}_{\alpha+\delta}^s = \sum_{\mathcal{S}_{1+\delta}^s} \Gamma_\omega^{<\alpha}$$

Proof. Suppose that $\delta = \sup_{i \in s}(\delta_i + 1)$.

Then $\alpha + \delta = \sup_{i \in s}(\alpha_i + 1 + \delta_i)$.

$$\mathcal{S}_{\alpha+\delta}^s = \sum_{i \in s} \mathcal{S}_{\alpha+\delta_i}^s = \sum_{i \in s} \sum_{\Gamma_\omega^{<1+\delta_i}} \Gamma_\omega^{<\alpha} = \sum_{\sum_{i \in s} \Gamma_\omega^{<1+\delta_i}} \Gamma_\omega^{<\alpha} = \sum_{\mathcal{S}_{1+\delta}^s} \Gamma_\omega^{<\alpha}$$

□

5 WO-Hausdorff rank

TBC.

6 Decidability of the rank

Definition 6.1. *A property* $\mathbf{P}$ *of linear orders is if* $\mathbf{type}_n[\mathbf{P}]$ *is computable as a function of* n.

Theorem 6.2 (Decomposition theorem)**.** *There exists a computable translation* $\mathcal{T}$ *from MSO formulae* $\varphi\left(\vec{X}\right)$,

such that for any $M = \sum_{i\in I} M_i$, *and formula* φ, *if* n *is the quantifier-depth of* φ, *then*

$$M, \vec{X} \models \varphi \iff I, \Pi \models \mathcal{T}\varphi$$

where $\Pi(i) = \mathbf{type}_n[M_i]$.

Corollary 6.3. *Let* $\mathbf{P}$ *be a property of linear orders labeled with colors* $\vec{C} = \{C_k\}_{k=1}^m$.

Let $\{\mathbf{Q}_k\}_{k=1}^m$ *be a family of (possibly labeled) properties.*

Let $n \in \mathbb{N}$.

We can compute the type $\mathbf{type}_n\left[\sum_{\mathbf{P}}\left[\vec{C} \leftarrow \vec{\mathbf{Q}}\right]\right]$ *from the types* $\mathbf{type}_n[\mathbf{P}]$ *and* $\mathbf{type}_n[\mathbf{Q}_k]$ *for all* k.

Proof. Let τ be an n-type of the appropriate signature.

Assume we have $\mathbf{type}_n[\mathbf{P}]$ and $\mathbf{type}_n[\mathbf{Q}_k]$ for all k. □

Definition 6.4. *Let* $\kappa \geq 0$ *be an ordinal.*

Let $\mathbf{op}$ *be a* κ*-ary operation on linear orders.*

Suppose that $\mathbf{op}$ *is invariant under* $\equiv_n$, *for some* $n \in \mathbb{N}$.

Then we extend $\mathbf{op}$ *to a* partial *operation on types as follows:*

$$\mathbf{op}\left(\{\mathbf{type}_n[M_i]\}_{i\in\kappa}\right) := \mathbf{type}_n\left[\mathbf{op}\left(\{M_i\}_{i\in\kappa}\right)\right]$$

This is well defined because of the invariance. Furthermore, we can extend it to a partial operation on sets of types in the obvious way.

Lemma 6.5. *There exists a global computable function* $h : \mathbb{N} \to \mathbb{N}$ *such that the following holds.*

Let $\mathbf{P}$ *be a property of linear orders.*

Let $\{\mathbf{Q}_i\}_{i=1}^k$ *be a finite set of properties of linear orders.*

Let $\{C_i\}_{i=1}^k$ *be a finite set of colors.*

Then $\mathbf{type}_n\left[\sum_{\mathbf{P}}\left[\vec{C} \leftarrow \vec{\mathbf{Q}}\right]\right]$ *is a computable function of* $\mathbf{type}_{h(n)}[\mathbf{P}]$ *and* $\mathbf{type}_n\left[\vec{\mathbf{Q}}\right] = \{\mathbf{type}_n[\mathbf{Q}_i]\}_{i=1}^k$.

Proof. □

Lemma 6.6. *Let* $\mathbf{Q}$ *be a good property of linear orders.*

There exists a computable function $f_{\mathbf{Q}} = f : \mathbb{N} \to \mathbb{N}$ *such that for all* $n \in \mathbb{N}$, *and all* $a \in \mathbb{N}$ *such that* $a \geq f(n)$, $\mathbf{type}_n\left[\mathbf{Q}^{\leq a}\right] = \mathbf{type}_n\left[\mathbf{Q}^{\leq f(n)}\right]$.

Equivalently, every linear order of finite rank is n*-equivalent to some linear order of rank* $\leq f(n)$.

Proof. Since there are only finitely many n-types, and the ω-sequence

$$\left\{\mathbf{type}_n\left[\mathbf{Q}^{\leq k}\right]\right\}_{k\in\omega}$$

is monotone, there must be some k where the sequence stabilizes.

This point k is computable as a function of n, because $\mathbf{type}_n\left[\mathbf{Q}^{\leq k}\right]$ is computable for every finite k. $\square$

Lemma 6.7. *There exist global computable functions $a, b : \mathbb{N} \to \mathbb{N}$ such that for all $n, c_1, c_2 \in \mathbb{N}$ such that $c_1, c_2 \geq a(n)$ and $c_1 \equiv c_2 \mod b(n)$,*

$$\mathbf{type}_n\left[\mathbf{Q}^{=c_1}\right] = \mathbf{type}_n\left[\mathbf{Q}^{=c_2}\right]$$

Equivalently, the sequence $\left\{\mathbf{type}_n\left[\mathbf{Q}^{k}\right]\right\}_{k\in\omega}$ is ultimately periodic for all $n \in \mathbb{N}$. Furthermore, the starting point and the period itself can be computed as a function of n.

Proof. Let $n \in \mathbb{N}$.

Since there are only finitely many sets of n-types, there exist (and can be computed) some $a(n) > f(n)$, $a(n) + b(n)$ such that

$$\mathbf{type}_n\left[\mathbf{Q}^{=a(n)}\right] = \mathbf{type}_n\left[\mathbf{Q}^{=a(n)+b(n)}\right]$$

holds for every s.

We shall prove by induction that for all $c \geq a(n)$,

$$\mathbf{type}_n\left[\mathbf{Q}^{=c}\right] = \mathbf{type}_n\left[\mathbf{Q}^{=c+b(n)}\right]$$

This will complete the proof.

The base case $c = a(n)$ has been proven in the beginning.

Suppose the induction hypothesis holds for c.

Let M be of rank $c + 1$.

Write $M = \sum_{i\in I} M_i$ where $M_i \in \Gamma_\omega^{<c+1}$, and $M_i \in \Gamma_\omega^{=c}$ infinitely many times.

By the induction hypothesis, if $M_i \in \Gamma_\omega^{=c}$, we can find $N_i \equiv_n M_i$ with $N_i \in \Gamma_\omega^{=c+b(n)}$. Setting $N_i := M_i$ for all other i, we conclude that $N := \sum_{i\in I} N_i$ is n-equivalent to M.

However, clearly $N \in \Gamma_\omega^{=c+b(n)+1}$. So overall,

$$\mathbf{type}_n\left[\mathbf{Q}^{=c+1}\right] \subseteq \mathbf{type}_n\left[\mathbf{Q}^{=c+b(n)+1}\right]$$

Conversely, suppose M is of rank $c + b(n) + 1$. Write $M = \sum_{i\in I} M_i$ where $M_i \in \Gamma_\omega^{<c+b(n)+1}$, and $M_i \in \Gamma_\omega^{=c+b(n)}$ infinitely many times.

By the induction hypothesis, we can find for all i such that $M_i \in \Gamma_\omega^{=c+b(n)}$ some $N_i \equiv_n M_i$ with $N_i \in \Gamma_\omega^{=c}$. Furthermore, since $c \geq a(n) > f(n)$, we can find $N_i \equiv_n M_i$ with $N_i \in \Gamma_\omega^{\leq f(n)<c}$ for all other i.

We conclude that $N := \sum_{i\in I} N_i$ is n-equivalent to M. However, clearly $N \in \Gamma_\omega^{=c+1}$. So overall,

$$\mathbf{type}_n\left[\mathbf{Q}^{=c+b(n)+1}\right] \subseteq \mathbf{type}_n\left[\mathbf{Q}^{=c+1}\right]$$

So we have proven the induction step, and the lemma follows. $\square$

Corollary 6.8. *Let $n \in \mathbb{N}$, and let $\alpha \geq \omega$ be an ordinal.*

Let $s \in \{1, \omega, \omega^*, \omega^* + \omega\}$ be a shape.

Then there exists a computable function $b(n)$ such that for all $c_1, c_2 \in \mathbb{N}$ such that $c_1, c_2 > a(n)$ and $c_1 \equiv c_2 \mod b(n)$, we have

$$\mathbf{type}_n\left[\mathcal{S}^s_{c_1}\right] = \mathbf{type}_n\left[\mathcal{S}^s_{c_2}\right]$$

Proof. For $s = 1$, it follows from lemma 6.6, since $\mathcal{S}^1_c = \mathbf{Q}^{<c} = \mathbf{Q}^{\leq c-1}$ by lemma 4.3. and $c > a(n) \geq f(n)$ so $c - 1 \geq f(n)$ for $c \in \{c_1, c_2\}$.

For $s \in \{\omega, \omega^*, \omega^* + \omega\}$, it follows easily from lemma 4.5 and lemma 6.7. $\square$

Lemma 6.9. *Let $n \in \mathbb{N}$, and let $\alpha \geq \omega$ be an ordinal.*

Let $s \in \{1, \omega, \omega^*, \omega^* + \omega\}$ be a shape.

$$\mathbf{type}_n\left[\mathcal{S}^s_\alpha\right] = \bigcup_{c<b(n)} \mathcal{S}^s_{a(n)+c}$$

In particular, $\mathbf{type}_n\left[\mathcal{S}^s_\alpha\right]$ can be computed, and is independent of the choice $\alpha \geq \omega$.

Proof. Draft:

$\square$

Definition 6.10. *Let $\alpha \geq \omega$ be an ordinal.*

Let M be a linear order and $x \in M$.

We define the convex equivalence relation:

$$\sim_\alpha := \sim_{\mathcal{B}\left[\Gamma_\omega^{<\alpha}\right]}$$

and $[x]_\alpha := [x]_{\mathcal{B}\left[\Gamma_\omega^{<\alpha}\right]}$ (that is, $[x]_\alpha$ is the largest $\mathcal{B}\left[\Gamma_\omega^{<\alpha}\right]$-subinterval containing x in M).

We define $\sigma_\alpha(M)$ as the α-shape of M.

Lemma 6.11. *The property $\cdot \in \Gamma_\omega^{=\alpha}$ is expressible over intervals in* $\mathbf{MSO}[\sim_\alpha, \sigma_\alpha]$

Proof. It is equivalent to being a sum of $\sim_\alpha$-subintervals, of which at least one has $\sigma_\alpha \neq 1$. $\square$

Theorem 6.12. *There is an oracle reduction from SAT for* $\mathbf{MSO}[\sim_\alpha, \sigma_\alpha]$*, to SAT for* $\mathbf{MSO}$.

Proof. By the decomposition theorem, there exists a translation, that given an $\mathbf{MSO}[\sim_\alpha, \sigma_\alpha]$ formula φ of quantifier-depth n. outputs an $\mathbf{MSO}$ formula $\psi(\Pi)$ such that...

Let φ be an $\mathbf{MSO}[\sim_\alpha, \sigma_\alpha]$ formula, and let n be the quantifier-depth of φ.

WLOG, assume that φ is a sentence.

First, let us calculate the sets:

$$T_s := \mathbf{type}_n \left[\mathcal{S}_\alpha^s\right]$$

for every shape s.

Now we create the formulae:

$$\theta_s(\Pi, \Xi) := \left\{ i : \bigvee_{\tau \in S_s} \Xi(\Pi(i)) = s \right\}$$

$$L(\Pi, \Xi) := \theta_\omega(\Pi, \Xi) \vee \theta_{\omega^*+\omega}(\Pi, \Xi)$$

$$R(\Pi, \Xi) := \theta_{\omega^*}(\Pi, \Xi) \vee \theta_{\omega^*+\omega}(\Pi, \Xi)$$

We create the formula $\chi(\Pi, \Xi)$ as follows:

$$\chi := \Pi = \mathit{domain}(\Xi) \wedge \forall i, i'.i' = i + 1 \implies i \in R(\Pi, \Xi) \vee i' \in L(\Pi, \Xi)$$

Now we claim that φ is satisfiable in $\mathbf{MSO}[\sim_\alpha, \sigma_\alpha]$ iff $\psi \wedge \chi$ is satisfiable in $\mathbf{MSO}$.

If φ is satisfiable, then there exists a model M of φ.

Let $M = \sum_{i \in I} M_i$ be the decomposition of M where $I =\sim_\alpha$ and M_i are the $\sim_\alpha$-equivalence classes.

By the decomposition theorem, Ψ holds in $I, \Pi := \mathbf{type}_n\,[\cdot]$.

We claim that χ holds in $I, \Pi := \mathbf{type}_n\,[\cdot]$.

It follows from the star property of $\sim_\alpha$ that the constraint holds.

Conversely, suppose $\psi \wedge \chi$ is satisfiable in $\mathbf{MSO}$.

Let $I, \Pi := T$ be a model of $\psi \wedge \chi$.

Let us take a model M_i with the appropriate type. Now define $M := \sum_{i \in I} M_i$.

We claim that each M_i is a *maximum* $\mathcal{B}\,[\Gamma_\omega^{<\alpha}]$-subinterval of M.

Suppose $[M_i, M_j]$ is a $\mathcal{B}\,[\Gamma_\omega^{<\alpha}]$-subinterval of M.

In particular, it has a rank, so it is scattered. So in particular, $[i, j] \subseteq I$ is a scattered interval.

If $i = j$ we are done. Otherwise, let i', j' be such that $i \le i' < j' \le j$, and $j' = i' + 1$. But it cannot be the case by the constraint. □

Theorem 6.13. *Suppose $\alpha_k > \alpha_{k-1} > \ldots > \alpha_0 > 0$ are ordinals.*

Then there is an oracle reduction from SAT for $\mathbf{MSO}[\sim_{\alpha_k}, \sigma_{\alpha_k}, \ldots, \sim_{\alpha_0}, \sigma_{\alpha_0}]$*,*

to SAT for $\mathbf{MSO}[\sim_{\delta_{k-1}}, \sigma_{\delta_{k-1}}, \ldots, \sim_{\delta_0}, \sigma_{\delta_0}]$*.*

where $\alpha_0 + \delta_i = \alpha_{i+1}$ for $0 \le i < k$.

Proof. By the decomposition theorem, there exists a translation, that given an $\mathbf{MSO}[\sim_{\alpha_k}, \sigma_{\alpha_k}, \ldots, \sim_{\alpha_0}, \sigma_{\alpha_0}]$ formula φ of quantifier-depth n. outputs an **MSO** formula $\psi(\Pi)$ such that...

7 Everything Better

Theorem 7.1. *Let $\mathcal{C}$ be a computable property of labeled linear orders, such that $\mathcal{C}$ is closed under taking subintervals, projections and inverse-projections (i.e, of one of the colors), and all finite-sums and $\mathcal{C}$-sums.*

Let $\mathbf{P}_1, \dots, \mathbf{P}_k \subseteq \mathcal{C}$ be computable properties of labeled linear orders.

Let $\mathbf{MSO}[P_1, \dots, P_k]$ be monadic second order logic of order over $\mathcal{C}$, with $P_1, \dots, P_k$ as monadic predicates whose semantics are: $P_i(X)$ holds iff X is a subinterval which satisfies $\mathbf{P}_i$.

Given ϕ a formula of $\mathbf{MSO}[P_1, \dots, P_k]$ (possibly with free variables) we define

$$\mathcal{C}_\phi = \{M \in \mathcal{C} : M \models \phi\}$$

(Note that M above may be a labeled *linear order.)*

Then $\mathcal{C}_\phi$ is a computable property of linear orders.

Proof. By structural induction on ϕ.

Suppose ϕ is an atomic formula. If ϕ is of the form $X \subseteq Y$ or $X \leq Y$,

$$\mathcal{C}_\phi = \{M \in \mathcal{C} : M \models \phi\}$$

and thus,

$$\mathbf{type}_n\left[\mathcal{C}_\phi\right] = \{\tau \in \mathbf{type}_n\left[\mathcal{C}\right] : \tau \models \phi\}$$

which is computable since $\mathbf{type}_n\left[\mathcal{C}\right]$ is computable, and we can then compute whether $\tau \models \phi$ for each $\tau \in \mathbf{type}_n\left[\mathcal{C}\right]$.

If ϕ is of the form $P_i(X)$, then

$$\mathcal{C}_\phi = \{M \in \mathcal{C} : M \models P_i(X)\}$$

and thus,

$$\mathbf{type}_n\left[\mathcal{C}_\phi\right] = \mathbf{type}_n\left[\mathbf{P}_i\right]$$

which is computable since $\mathbf{P}_i$ is computable.

If $\phi = \neg\phi_1$, then

$$\mathcal{C}_\phi = \mathcal{C} \setminus \mathcal{C}_{\phi_1}$$
